

Simplify voter verification with Diebold's full-function electronic poll book.

- Immediate, automated voter verification at each precinct
- Links voter registration system, voting system and polling place
- Virtually eliminates costs associated with printing paper poll books and updating voter history files
- Reduces provisional voting and calls to election central
- Automates upload of voter history data
- Streamlines and simplifies election day processes for poll workers

The Diebold Election Systems ExpressPoll™-4000 provides an automated solution that streamlines the voter verification process at polling locations while significantly reducing costs for the jurisdiction. ExpressPoll-4000 can integrate your voter registration system, voting system and polling place, providing election officials with voting procedure automation and convenience unique in the voting system market.

Powerful and Easy to Use

The lightweight ExpressPoll-4000 can store registered voter information for a precinct, a district or for the entire jurisdiction. A poll worker can input one or a combination of the following elements onto the large ten inch touch screen to verify a voter is registered: the voter's last name, first name, middle initial, voter ID number, date of birth, and/or the driver's license number. The ExpressPoll-4000 is very intuitive, requiring minimal poll worker training for full feature operation.

Once the poll worker has verified that the voter is eligible and in the proper polling location, ExpressPoll can enable the poll worker to program the voter's Voter Access

ExpressPoll-4000 allows immediate, automated voter verification; shown with optional voter card encoder, bar code reader and signature pad accessories.

Proven solutions from the world's leading supplier of electronic voting systems.

Card for use in Diebold AccuVote-TSX and AccuVote-TS touch screen voting stations. The Voter Access Card is programmed with the appropriate ballot style, and other important characteristics as needed including: provisional voter designation, voice guidance activation and ballot magnification. The information presented on the screen of the ExpressPoll can notify the poll worker if a voter has already requested an absentee ballot, whether a voter must provide identification before voting, whether voters have already been issued provisional ballots, and determine if provisional ballots should be issued.

Creates Polling Place Efficiency

A jurisdiction-wide voter database can be stored on the ExpressPoll-4000 to aid voters who arrive at the wrong polling location. A polling place official can direct the voter to the correct polling location by providing the appropriate street address, as well as by showing (and/or optionally printing) a map of the correct location. This capability significantly reduces poll worker calls into the registration office during the election to determine the correct precinct location for a voter. It also reduces provisional voting, as the respective voter's precinct can be immediately identified.

Streamlines Processes

Storing registered voter information on the unit's memory card can be accomplished quickly and efficiently after voter registration closes. The ability to rapidly duplicate final voter registration files and effortlessly insert this information into the ExpressPoll streamlines this important pre-election task.

The ExpressPoll-4000 retains all transactions to an audit log file that is redundantly stored in two different locations within the unit. At the conclusion of the election, voter history data can be automatically transferred to the jurisdiction's voter registration system.

Reduces Costs

The ExpressPoll-4000 virtually eliminates the need for paper poll books which are costly to print. Because voter history data can be automatically transferred to the jurisdiction's voter registration system, substantial costs associated with days or weeks of post-election manual voter name logging are eliminated.

Provides Functionality and Flexibility

The ExpressPoll-4000's optional signature pad can enable poll workers to compare captured signatures with those stored in the voter registration system and update them as needed. An optional bar code scanner enables voter information cards with bar codes to be scanned, allowing immediate voter verification. The

operation. The ExpressPoll also has the capability to track and capture poll worker hours for easy payroll calculation (part-time and full-time).

ExpressPoll can enable the poll worker to program the voter's Voter Access Card for use in Diebold AccuVote TSX and AccuVote TS touch screen voting stations.

A polling place official can direct the voter to the correct polling location by showing (and/or optionally printing) a map of the correct location.

magnetic stripe or a bar code on a voter's driver's license can also be scanned to automatically retrieve voter information from the ExpressPoll database.

The ExpressPoll-4000 securely stores voter information databases on a large-capacity compact flash memory card. An integral battery supply provides a minimum of three hours of backup power should the primary AC power source be interrupted. The touch-screen portion of the ExpressPoll can be removed from its base for convenient desk-top or hand held

The ExpressPoll-4000 is very flexible, enabling it to integrate with Diebold Election System's line of touch-screen systems, Diebold's DIMSnet voter registration software solution as well as other election system technologies and voter registration systems.

The ExpressPoll-4000 provides the technical capacity for future polling place evolution which could include everything from Super Precincts to complete Jurisdiction-Wide Convenience Voting.
